Brief Description of Arguments to be Presented:

Compliance of claims 47-49 to 35 U.S.C. 112, identification of the support. Discussion about of the concept differences between current invention and Lonkey (US 6641575). The main difference between the present invention and the cited prior art is the positioning of the anchoring point, to which the anchoring means are coupled, to in the internal surface of the abdominal wall. The main advantage provided by the present invention is that the location of the anchoring point at an internal surface of the abdominal wall within said cavity prevents the creation of an additional opening in the patient's body at the anchoring point. Lonkey discloses 3 main embodiments of the anchoring: (a) retraction to an external framework such as a frame anchored to or adjacent to the surgical field; (b) Retraction to a frame which is coupled to the table; or (c) Retraction to a self retaining retractor at the incision which is, according to Lonkey, the patient's skin. In all of the above, there is no mentioning of anchoring to the internal surface of the abdominal wall.
